

Introducing E L I
Emergency Location Interactive
Technology for Location Based Security by EXPOCAD®

Developed for first responders, show management, building personnel, security teams, etc. to immediately convey where an actual occurrence is happening at an event or to locate a security breach or concern. Teams communicate simultaneously to identify the targeted area.

ELI saves precious seconds or minutes in any emergency. Location links assist in responding faster and accurately using any venue indoors or out including loading docks, classrooms, hallways, parking lots, lobbies or anywhere the event reaches.

A single click location indicator on the event map will text to the appropriate individuals such as security chief, show manager, venue personnel, etc. Emergency location links are ideal for pinpointing where immediate attention is required such as an unknown or suspicious package, an active shooter, fire, medical emergency, etc.

Offers discreet and non-verbal communication to prevent inflating an occurrence.

Uses text messaging, a more reliable and undetectable form of communication.

Cannot be intercepted by other types of radios and frequencies or scanners.

No APP Required.

Uses standard smart phones and mobile browsers.

Side benefit: Searchable interactive floor plan of the venue and exhibitors.
